IR DISTRIBUTION OVER COAX KIT

This kit allows IR signals to be inserted onto a coax cable in one location and extracted from coax on another location.

We are all familiar with infra-red remote controls because we use them to operate our tv, dvd players etc. On a daily basis. However, you might not be familiar with "IR repeating." IR repeating allows you to control devices that are not within the direct line of sight of your remote control. This kind of a system is commonly used in distributed audio/ video systems where the source components are centrally located, or when you wish to control your source devices remotely from an entirely different location.

- Creates an IR system with existing wiring
- Power 4 IR receivers with one power supply (included)
- Quick and easy installation

Kit contents:

- **IR injector**
Passes the TV signal from input to output
Injects the signal from the infrared receiver to the side of the injector that goes "upstream" to the coupler
Connects power from the power supply to the infrared receiver
- **IR coupler**
It passes the TV signal from input to output
It extracts the infrared signal from the downstream injector to drive one or more infrared emitters
- Dual IR emitter (also sold separately PR01142 > 37168732)
- Mini sticker IR receiver
- 12 V DC 200 mA power supply
