1.0 SETUP

1.1 INITIAL POWER UP

Out of the box the Redback® A 6530 or A 6540 series wall plate comes loaded with a default program for initial testing. Six buttons have been programmed into the plate which can be used to test the the outputs of the Redback® A 6505A Serial Hub. Connection between the two devices is illustrated in figures 2.1 and 3.1 of the accompanying Operating Manual. The six buttons are labelled serial 1, serial 2, IR, Relay 1, Relay 2 and Relay 3. When these buttons are pressed the corresponding ouput LED on the A 6505A will illuminate to show it is active.

1.2 ACCESSING THE SOFTWARE

Programming the wall plate requires the PC software which is stored on the wall plate. To access the software insert the blank supplied micro SD card into the slot at the bottom of the wall plate. The wall plate will recognise the card insertion and display three options as shown in figure 1.0

Select the second option (DOWNLOAD PLATE FILES TO THE SD CARD) and follow the prompts. The contents of the wall plate will be copied across to the SD card. *Note: The contents of the micro SD card will be erased during this process.* Two animated dots can be seen rotating during the erasure and copying processes. If the dots stop rotating then the wall plate has locked up. Wait for 2 minutes and if the problem is not resolved turn the power off and then remove the micro SD card. Reconnect power and try again.

In order to access the program, the Micro SD card will need to be connected to a Windows based device such as a PC or laptop with Windows 7 or above installed. It will need to be equipped with a Micro SD card reader to do this. If a Micro SD slot is not available then the Redback D 0371A USB Memory Card Reader or similar would be suitable (not supplied).

Make sure the Windows based device is on and card reader connected and correctly installed. Then insert the Micro SD card into the reader.

Go to "My Computer" or "This PC" and open the Micro SD card which is usually marked "Removable disk".

It is recommended that a copy is made of the contents of the Micro SD Card before any programming is done. This may come in handy if the SD card becomes corrupted and it also provides a default setup to fall back on.

The contents of the Micro SD card should include the programming software (labelled A65XX_Keypad_Programmer_XXXX) and a library of button lcons.

The Firmware folder holds the current firmware version supplied with the plate. Firmware updates are available for download from www.redbackaudio.com.au. If an update is performed (see section 1.3) and fails to update, or the update is found to have errors then the wall plate can be restored back to its default firmware version with the file in this folder. (NOTE: The System Volume Information folder is part of the SD Card format. Do not modify this folder).

1.3 FIRMWARE UPDATE

It is possible to update the firmware for this unit by downloading updated versions from redbackaudio.com.au. To perform an update, follow these steps.

1) Download the Zip file from the website.

2) Disconnect power from the wall plate. Remove the Micro SD card and insert it into your PC. (Follow the steps on page 3 to open the micro SD card).

- 3) Extract the contents of the Zip file to the root folder of the Micro SD Card.
- 4) Rename the extracted .BIN file to update.BIN.

5) Remove the Micro SD card from the PC following windows safe card removal procedures.

6) With the power disconnected from the wall plate, re-insert the Micro SD card.

7) Reconnect power to the wall plate. The unit will check the Micro SD card and if an update is required the wall plate will perform the update automatically.

1.4 RUNNING THE SOFTWARE

It is recommended to run the programming software from the SD card.

Double click on the file - A65XX_Keypad_Programmer_XXXX. The programming screen should appear as shown in Figure 1.2.

Fig 1.2

If the program doesn't run then the .NET Framework might need to be updated on your PC. This must be updated to the .NET Framework 4 or above, available on the microsoft website.

From this startup screen the available options are to either access the File, Button, Power Settings, Screen, PIR or Polling Tabs as shown in figure 1.3.

Fig 1.3

The "File" tab provides the standard Windows operating system functions of New, Open, Save and Save As. It is recommended that the configuration is saved to the Micro SD card by using the "Save" option. But the "Save As" option is available so the setup can be saved elsewhere.

2.0 DEFAULT CONFIGURATION

Lets take a brief look at the default configuration.

Navigate to the "File" tab and then select "Open". The window shown below in figure 2.1 should appear.

We need to navigate to the location of the config file which for our example is on the root folder of the micro SD card which is Removable disk (O).

R A	ltronics A650	00 Keypad Program	nmer [1.0.0	.13] -					\times
File	Button	Power Settings	Screen	PIR	Polling	Simulate			
Yo	ur Plate	Show Sub Page					Browse For Folder × > This PC • > Libraries • > Removable Disk (O:) • > USB Drive (K:) • > USB Drive (N:) • > USB Drive (N:) • > Network • Make New Folder OK Cancel		

Fig 2.1

We select Removable Disk (O) and then OK.

The default configuration should load and display as shown in figure 2.2.

🔡 Al	tronics A6500 Keypad Programmer - J:\					-	×
File	Button						
	Button Your Plate	Button Actions Button Label	SERIAL 1 Name SERIAL 1 TEST] Type Serial	Single Action Details Send SERIAL1 on Port 0 and delay for Add Delete	○ Double Action 100ms	
	RELAY 2 RELAY 3						

Fig 2.2

Notice that the simulation of the screen (under the text "Your Plate") displays exactly what is displayed when the A 6530 or A 6540 series wall plate is powered up.

As this configuration is only used for testing we won't go into more detail.

3.0 CREATE A NEW CONFIGURATION

Navigate to the "File" tab and then select "New". The window shown below in figure 3.1 should appear.

Once again it is recommended (if not done previously) that a copy is made of the default contents of the Micro SD Card before a new configuration is saved.

🔏 Ali	tronics A650	0 Keypad Program	nmer [1.0.0	.13] -							×
File	Button	Power Settings	Screen	PIR	Polling	Simulate					
	Button r Plate	Power Settings		PIR	Polling	Simulate					

Fig 3.1

4.0 ADDING BUTTON ICONS

Programming the button icons is quite simple. Navigate to the Button tab and select "Add New" or press the "Insert" button on your computer's keyboard. The default "Smiley face" button Icon will appear in the centre of the wall plate simulator as shown in figure 4.1. The simulator section displays exactly what will appear on the wall plate once operational.

🔏 Al	tronics A650	0 Keypad Program	nmer [1.0.0	.13] - *		-		×
File	Button	Power Settings	Screen	PIR	Polling Simulate			
You	ır Plate	Belon 1			Button Actions Button Label Button 1 Opens Sub Page Single Action Double Act Name Type Details Add Delete Mail Plate Screen Simulator		Splash Screen	

Fig 4.1

Any number of buttons can be added at this stage up to a maximum of 12 buttons as shown in figure 4.2. This screen is called the Home Page. Each of the 12 buttons on this screen have the option to go to a sub page once pressed ,and each sub page can have up to 11 buttons (Sub pages are explained in section 17).

(NOTE: There is no option to change the size of the icons on the screen i.e. The buttons are a fixed size regardless of the number of buttons selected).

Fig 4.2

Obviously a screen full of smiley faces doesn't provide a very good visual indicator of the functions of the buttons. The button icons can be changed to those supplied in the Icon Library, or you can create your own. The Icon image is 60 pixels x 60 pixels and can be created and saved as a bitmap image using other readily available image creation software.

It is also possible to import most image files of any size which will be converted by the software to a bitmap image making it available as an icon.

5.0 CHANGING BUTTON ICONS

Changing the button lcons is simply a matter of selecting the lcon from the screen simulator and then clicking on the lcon under the button label as highlighted in figure 5.2.

The Select Icon window should appear as shown below. From here it is possible to scroll through the icons in the icon library, or by pressing the browse button (highlighted in figure 5.1) navigate to an icon or image stored elsewhere. Select the icon or image and then press OK.

Select Icon					
Icons in J:\Icon Library	wr-Record.bmp	wr-Repeat.bmp	wr-Return.bmp	wr-Shuffle.bmp	
Icon Na	me		-	ame with a maximum of umbers, letters, unders	BROWSE f 8 digits).
ОК			Cancel		

Fig 5.1

The updated icon should now replace the selected icon. In our case we have selected wr-Power.bmp. We then changed the button label to "Power" by typing in the new name in the Button Label section. The new label now appears below the icon on the wall plate simulation.

(NOTE: Button labels can be a maximum of 12 characters long).

🔏 Altronics A6500 Keypad Programmer [1.0.0.13] - *	×
File Button Power Settings Screen PIR Polling Simulate	
File Button Power Settings Screen PIR Polling Simulate	

6.0 SAVING AND UPLOADING THE BUTTON CONFIGURATION

At the top of the programming window the location of the save file is shown (In our case the program is saved to the SD card which is the path to the Removable disk (J:). The asterisk at the end of the path signifies that the program has changed since it was last saved.

Save the program by selecting File/Save (see Fig 6.1) or by pressing Ctrl+S.

Altronics A6500 Keypad Programmer [1.0.0.13] - *		– 🗆 X

Exit Button 2 Button 3		
Button 4 Button 5 Button 6		Splash Screen
	Add Delete ↑ ↓	
Button 7 Button 8 Button 9		
Button 10 Button 11 Power		
Show Sub Page		

The saved program can now be uploaded to the wall plate. Remove the micro SD card from the PC following safe removal procedures and insert it into the bottom of the wall plate. The wall plate will recognise the card insertion and display three options as shown in figure 6.2.

Select the first option "UPLOAD SD CARD FILES TO THE PLATE" and follow the prompts.

Make sure to remove the micro SD card when prompted.

Note: The micro SD card does not need to remain inside the wall plate after the upload for correct operation.

The contents of the micro SD card will be copied across to the wall plate. Two animated dots can be seen rotating during the copying process. If the dots stop rotating then the wall plate has locked up. Wait for 2 minutes and if the problem is not resolved turn the power off and then remove the micro SD card. Reconnect power and try again.

6.1 COPYING THE CONFIGURATION FOR USE ACROSS MULTIPLE JOBS

Sometimes the same setup is required for different jobs, an example might be setting up a school where multiple classrooms have the same equipment setup. One micro SD card can be used for multiple jobs simply by uploading the files from the SD card to multiple plates.

7.0 SWAPPING BUTTONS

The position of the buttons can be moved around the screen by using the "Swap with" command located in the Button/Swap with tab as shown in figure 7.1. Simply select the button to swap and the buttons will swap accordingly.

Fig 7.1

In our example we have swapped button 1 with button 12, the result is shown in figure 7.2

Fig 7.2

8.0 DELETING BUTTONS

Buttons can be removed from the screen by navigating to the Button/Delete tab and pressing delete. (NOTE: Make sure you have selected the button to be removed beforehand).

9.0 ADDING SERIAL COMMANDS TO BUTTONS

To configure a serial command to a button, select the button from the Wall Plate Screen Simulator and then press the "Add" button as shown in figure 9.1.

File Button Your Plate Button 2 Button 3 Button Label Power O Double Action Name Type Details	
Power Button 2 Button 3 Button Label Power Name Type Details	
Button 4 Button 5 Button 8 Button 7 Button 8 Button 9 Button 10 Button 11 Button 1 Simulate	

The "Add New Command" window should appear as shown in figure 9.2 and will default to the Serial command type.

Add New Command						
Command Type Serial	Name New Command					
Port Speed 115200	Stop Bit					
Bits Parity 5 V None V	Delay (ms) 0 ~					
Code	Format Hex V					
ОК	Cancel					

This is where all the serial command parameters are set. The Port refers to output port of the A 6505A serial hub and is either Port 1 or 2. (*NOTE: Older versions of the software may have the option of Port 0 or 1.*)

The serial transmission parameters are set by simple drop down boxes, for the baud rate (Speed), Stop bits, transmission Bits and Parity.

The Delay refers to the amount of time the system will wait after the command is exectued. This has the option of 10,100 or 1000 milliseconds via the drop down box or any time period can be entered manually.

The Code is the serial code to be output, which can be in either HEX or ASCII format as selcted by the drop down box. The Name provides the user with a way of creating a meaningful description of the command.

In the example below, we have set the output port to 0 (which will output from Port 1 of the A 6505), set the transmission speed to 9600 baud, with 1 stop bit, 8 bits of data and parity None. The transmission code is FFFF in HEX format, we have set a delay of 1 sec (1000ms) and labelled the command Turn Device ON.

(Note: Spaces cannot be used in the HEX code. They are invalid).

Add New Command	
Command Type Serial	Name Tum Device DN
Port Speed Image: Optimized state 9600	Stop Bit
Bits Parity 8 ~ None ~	Delay (ms)
Code	Format
FFFF	Hex ~
ОК	Cancel

Fig 9.3

After pressing "OK", the resultant command line is shown below in figure 9.4. All the settings are now visible and can be deleted or edited from this screen (double click the line to edit).

🔛 Altronics A6500 Keypad Programmer - *					×
File Button					
File Button Your Plate Power Button 2 Button 3 Button 4 Button 5 Button 6 Dutton 6	Button Actions Button Label Power Name Tum Device ON	Single Action Type Details Serial Send FFFF on Port 0 and delay f Add Delete	O Double Action	>	
Button 7 Button 7 Button 10 Button 11 Button 11 Button 11 Button 11 Button 11					

Fig 9.4

10.0 ADDING RELAY COMMANDS TO BUTTONS

To configure a relay command to a button, select the button from the Wall Plate Screen Simulator and then press the "Add" button as shown in figure 9.1.

The "Add New Command" window should appear as shown in figure 9.2 and will default to the Serial command type. Select the "Relay" tick box and the window should change to that shown below in figure 10.1.

Add New Command	
Command Type O Serial	O IR New Command
Output 1 ~	Action OFF ~
Hold (ms) 0 In TIMED mode, the relay will stay on for this value and then tum off.	Delay (ms) 0 ~
ОК	Cancel

Fig 10.1

From here we can select the relay output 1-3 (of the A 6505A Serial Hub) and determine the action for that relay. The relay can be set to OFF or ON, the output can be set to toggle it's state each time the button is pressed or the relay can be set to a timed output which will remain on for 10, 100, 1000 or 10,000 milliseconds (set by the "Hold" drop down box) or

any time period can be entered manually.

The Delay refers to the amount of time the system will wait after the command is exectued before performing any more tasks. This has the option of 10,100, 1000 or 10000 milliseconds via the drop down box or any time period can be entered manually.

Add New Command	
Command Type O Serial	O IR Tum Relay 1 ON
Output 1 ~	Action TIMED ~
Hold (ms) 10 ~ In TIMED mode, the relay will stay on for this value and then tum off.	Delay (ms) 10 ∽
ОК	Cancel

Fig 10.2

In the example shown in figure 10.2, we have set the output to relay 1, and set the action to a timed output which will activate the relay for 10 milliseconds. We have also set a delay of 10 milliseconds and labelled the command "Turn Relay 1 ON". After pressing "OK", the resultant command line is shown below in figure 10.3. Two command lines are visible in the button actions window. The first line is the command from the example in section 9.0 and the second line is the example in this section.

Fig 10.3

Either line can be deleted or edited from this screen (double click the line to edit) and the order of events can also be modified by selecting the line and then using the up and down arrows to change its position in the list. Each button can have an unlimited number of commands.

(NOTE: while the commands for a button are being executed the wall plate will not respond to other button presses).

11.0 SIMULATING BUTTON PRESSES

The actions of the buttons can be simulated in real time without the need to insert the SD card into the wall plate. Simply press the simulate button under the screen simulator (or on the top tab bar) and then view the command results when the buttons are pressed.

Fig 11.1

12.0 SETTING RELAY COMMANDS WHEN USING THE A 6530 or A 6540 series AND THE A 6510/ A 6515

In order to use the relay outputs of the Redback® A6510 or A 6515 when using the CAT5 direct connection from the A 6530 or A 6540 series wall plate (see fig 12.2 and 12.3), specific serial commands have to be sent. These external relays cannot be activated using the standard relay commands.

Follow the same steps as outlined in section 9.0 to create a new serial command for a button through the Add New Command window.

There are three options for the state of the external relays, ON, OFF or Toggle.

Specific ASCII codes have to be sent to switch the desired relays.

Figure 12.1 illustrates the settings required to toggle relay 1.

The port must be set to 1, the speed to 9600 baud, the stop bit to 1, data bits to 8, parity to none and the format must be ASCII.

13.0 SETTING COMMANDS FOR EXPANDED RELAY SYSTEMS USING THE A 6505A and A6510 or A 6515

In order to make use of the expanded relay outputs of the Redback® A6510 or A 6515 when using the A 6505A serial hub (see fig 13.2 and 13.3), specific wiring is required and certain serial commands have to be sent. This is to avoid clashes with the relay outputs of the A 6505 serial hub which makes use of the standard relay commands.

13.1 SERIAL COMMANDS TO CONTROL A 6510 RELAYS

Follow the same steps as outlined in section 9.0 to create a new serial command for a button through the Add New Command window.

There are three options for the state of the external relays, ON, OFF or Toggle.

Specific ASCII codes have to be sent to switch the desired relays.

Figure 13.1 illustrates the settings required to toggle relay 1 on the A 6510.

The speed is set to 9600 baud, the stop bit to 1, data bits to 8, parity to none and the format must be ASCII.

The port is set to match the output port used on the A 6505A serial hub.

The code to be sent is quite simple.

The code starts with the word RELAY followed by

13.2 SERIAL COMMANDS TO CONTROL A 6515 RELAYS

Follow the same steps as outlined in section 9.0 to create a new serial command for a button through the Add New Command window.

There are three options for the state of the external relays, ON, OFF or Toggle. Specific ASCII codes have to be sent to switch the desired relays.

Figure 13.3 illustrates the settings required to toggle relay 13 on the A 6515.

The speed is set to 9600 baud, the stop bit to 1, data bits to 8, parity to none and the format must be ASCII. The port is set to match the output port used on the A 6505 serial hub.

Edit Command Type Serial Relay R Name Toggle Relay 13 Pot O O I Speed Stop Bit 1 ~ Bits Parity None Code RELAYT13 OK Cancel Fig 13.3	The code star T for toggle (t with each pre O (capital o) f I (capital i) for followed by th So for instance be RELAYI13. RELAYT14 and It is also possi using the star (capital i) for (as the relay m so the comma	or OFF (this turns the relay Off). ON (this turns the relay On). The relay number. The to turn on relay 13, the code would To toggle relay 14, the code would be d so on. ble to turn all relays ON or OFF by indard format of O (capital o) for OFF, I ON and then by using the number 99
Redback@ A 6500 Redback@ A 6500 Redbac	TROLLED ES	NOTE: The A 6515 relays are numbered 13 & 14. A 6515 DIP Switch Settings NOTE : Only one DIP swiitch can be set to ON. DIP Switch 1 must be set to ON when using the RS485 input of the A 6515. DIP Switch 2 must be set to ON when using the RS232 input of the A 6515. All other DIP switches must be OFF.

RELAY CONTROLLED DEVICES (CONTACTS MAX 16A)

14.0 SERIAL COMMANDS FOR THIRD PARTY CONTROL OF THE A6510 AND A 6515

The Redback® A6510 and 6515 relay boxes can both operate without the need for the Redback® A 6530 or A 6540 series wall plate or the Redback® A 6505A serial hub.

Third party control is achieved by sending serial commands to the RS232 or RS485 inputs of the A6510 or A 6515 as shown in figure 14.1.

The serial data sent has to transmitted at 9600 baud, with the stop bit set to 1, data bits to 8, parity to none and the format must be ASCII.

The code to be sent is quite simple. The code starts with the word RELAY followed by

T for toggle (this alternates the state of the relay with each press). O (capital o) for OFF (this turns the relay Off). I (capital i) for ON (this turns the relay On).

followed by the relay number.

So for instance to turn on relay 13, the code would be RELAYI13. To toggle relay 14, the code would be RELAYT14 and so on.

Fig 14.1

It is also possible to turn all relays ON or OFF by using the standard format of O (capital o) for OFF, I (capital i) for ON and then by using the number 99 as the relay number.

So the command RELAYI99 will turn all relays ON and the command RELAYO99 will turn all relays OFF

15.0 ADDING IR COMMANDS TO BUTTONS

To configure an IR command to a button, select the button from the Wall Plate Screen Simulator and then press the "Add" button as shown in figure 9.1.

The "Add New Command" window should appear as shown in figure 9.2 and will default to the Serial command type. Select the "IR" tick box and the window should change to that shown below in figure 15.1.

Add New Comma	nd		
Command Type O Serial	O Relay	● IR	Name New Command
IR Code			~
Delay (ms)	~		Add IR File
			Add Pronto HEX
ОК			Cancel

Fig 15.1

From here we have two methods of adding IR commands, which include adding an already saved IR code or by adding a Pronto HEX code. We also have the delay option which refers to the amount of time the system will wait after the command is exectued before performing any more tasks. This can be set to 10,100 or 1000 milliseconds.

15.1 Learning IR Codes

Insert a USB keyboard into the Micro USB socket on the bottom of the A 6530 or A 6540 series wall plate. NOTE: An OTG (On The Go) cable (such as the supplied Redback P 1921) will be required between the USB Keyboard and the Micro USB socket on the wall plate.

The wall plate will automatically recognise the connection of the keyboard and will request the user to enter the name of the button to be learned.

Enter the name of the button e.g. DVDPLAY and then press enter. (Note: Spaces are not available). Now press the remote control button to be recorded. The wall plate will record the IR code to the SD card for the duration of the button press and will recognise when the button is released.

Once the IR code has been stored, there is the option to test the code if required in FORCED or NORMAL mode. In order to test the IR output, the Redback® A 6505A Serial Hub will need to be connected to the A 6530 or A 6540 series wall plate. Connect an IR repeater to the IR output (Refer to figure 2.2b and 3.1 in the Operating Manual) and point the IR repeater at the piece of equipment to be controlled.

Follow the on screen prompts to first test the IR code in FORCED mode and then in NORMAL mode. Testing the codes at this stage provides instant feedback of the codes working as required. Both codes are stored on the SD card for use, in the IRFORCED and IRNORMAL folders under the name entered by the user. e.g. DVDPLAY.

Remove the keyboard when finished recording IR codes and the wall plate will automatically restart.

Insert a Micro SD card into the A 6530 or A 6540 series Wall Plate. The wall plate will recognise the card insertion and display three options as shown in figure 1.0

Select the second option (DOWNLOAD PLATE FILES TO THE SD CARD) and follow the prompts. The contents of the wall plate will be copied across to the SD card.

Note: The contents of the micro SD card will be erased during this process.

Remoce micro SD card from the wall plate and insert into a PC or laptop.

These codes can now be retrieved by using the Add IR File button in the "Add New Command" window.

15.2 Add IR File

IR codes can be added to a button by pressing the "Add IR File" button on the Add New Command window as shown in figure 15.2. Once pressed the file navigator will open, then simply navigate to the location of IR files. They may be in the supplied IR LIBRARY folder on the SD card, or any saved IR codes created by using the IR learning facility on the wall plate (see section 15.1 for details) which will be saved to the SD card in the IRFORCED or IRNORMAL folders.

Add New Comma	nd			
Command Type	O Relay	● IR	Name New Command	
IR Code			~	
Delay (ms) 0	~		Add IR File	
			Add Pronto HEX	
ОК			Cancel	Fig 15.2

For our example we want to make button 2 play a DVD. We change the Icon of button 2 to a Play Icon available from the icon library. We then create a new IR command using the method in section 15.0. We navigate to the IRNORMAL folder on the SD card (see figure 15.3) and select the DVDPLAY file which we created in section 15.1 and press Open.

🔛 Open				×
← → × ↑ 📙 > Removab	le > IRNORMAL	ע ט Search	IRNORMAL	Q
Organize 🔻 New folder			118 111 111	?
 Music Pictures Videos Acer (C:) DATA (D:) DVD RW Drive (E:) USB Drive (G:) USB Drive (H:) USB Drive (I:) USB Drive (I:) Removable Disk (J:) 		JPLAY		
File name:				~
L		0	pen Canc	el

The IR file is now listed in the IR Code drop down box as shown in figure 15.4. Select DVDPLAY and then press OK.

I	Add New Comma	ind				
	Command Type	⊖ Relay	● IR	Name New Command		
	IR Code DVDPLAY			~	>	
	Delay (ms) 0	~		Add IR File		
				Add Pronto HEX]	
	ОК			Cancel		Fig 15

The resultant command line now appears in the button actions window as shown in figure 15.5.

15.3 Add Pronto HEX File

Pronto HEX format IR codes are readily available and remove the need to learn IR codes. These codes are easily accessible on the internet, but be warned that not everything available will work.

IR codes can be added to a button by pressing the "Add Pronto HEX" button on the Add New Command window as shown in figure 15.6.

Add New Comman	nd		
Command Type O Serial	◯ Relay	● IR	Name New Command
IR Code			~
Delay (ms)	~		Add IR File
			Add Pronto HEX
ОК			Cancel

Fig 15.6

Once pressed the "Create Pronto HEX Command" window will appear (refer to figure 15.7).

Create Pronto HEX Command	
Command Name	
~	
Please enter your Pronto Hex data as 4-digit Hex values with a space between each value. e.g. 0000 006C 0022 0002	
OK Cancel	Fig 15.7

From here it is simply a matter of copying the HEX codes from a webpage or other document and pasting them into the window. For our example we changed the Icon of button 3 to a Stop Icon available from the icon library. We have then copied the Pronto HEX codes from a webpage. We name the command Sony DVD Stop. The result is shown in figure 15.8.

(Note: When entering IR PRONTO HEX codes, spaces are valid between each HEX code but invalid at the start and end of the group. Make sure there isn't a space at the end of the group of codes).

Create Pronto HEX	Command

16.0 DOUBLE ACTION BUTTONS

Previous sections have covered buttons with a single action but it is also possible to give a button two actions for situations like turning a device on/off, pressing play/pause etc.

In this section we will cover a dual action button, to play and stop a DVD player with IR codes, using the codes covered in section 15.0.

Begin by selecting the button to become a dual action button, which in our case is the Play button and then press the "Double Action" option as shown in figure 16.1.

Fig 16.1

When the "Double Action" option is selected, a copy of the single action button is created with the same Icon and commands.

The second action for our example is to stop the DVD playing. We click on the lower Play icon and change this to the Stop icon. We then double click on the command line and change the command to the IR Pronto HEX command used in section 15.3 to stop playing the DVD. The button label is renamed to DVD and the result is shown in figure 16.2.

Fig 16.3

As in single button configurations, both actions can have multiple command lines.

17.0 SUB PAGES

The A 6530 or A 6540 series Wall plate has provision for sub pages which are associated with the buttons on the home page. The home page can have a maximum of twelve buttons, and each of those twelve buttons can have a sub page with another 11 buttons.

In the example of figure 17.1 a new program has been created with 12 buttons on the home page. The install requires a DVD player to be controlled from the A 6530 or A 6540 series, but to completely control the DVD player all of the home page buttons would be required. This isn't practical, so instead a sub page will be used which will house all of the DVD player controls.

In our example one of the buttons is labelled DVD and the Icon updated. To associate a sub page to the button, simply tick the "Opens Sub Page" tick box.

The "Show Sub Page" button underneath the simulator screen is now active and can be used to display the sub page.

Button 10 Button 11 DVD			
Show Sub Page			

Fig 17.1

The sub page as shown in figure 17.2 has a "Home Page" Button which can be re-labelled and the button lcon updated just like any other button.

It is worth noting that any button can be used to execute commands, including the Home Page button and any Sub Page button. So for instance a command could be sent to the DVD player (by adding a command in figure 17.1) to "Power On" the DVD Player when the DVD sub page is activated. Similarly a command could be added to the Home Page button in figure 17.2 which is executed before returning to the home page.

Fig 17.2

To control the DVD player all of the required buttons can now be added to the sub page as illustrated in figure 17.3. All of the buttons could then be given IR commands for instance, to control the DVD player (refer to section 15 to add IR commands to buttons).

Fig 17.3

To return to the home page screen, press the "Show Home" button.

This process can then be repeated to add sub pages to other home page buttons .

18.0 SPLASH SCREENS

Splash screens provide the ability to display a full screen message or image when a button is pressed. They can be included at any point in the command lines for the button. *Note: Only one splash screen can be used per button*.

The screensaver image is 240 pixels x 320 pixels and must be one of the following valid image formats jpeg, png, gif and bmp. The images can be created and saved using readily available image creation software.

It is also possible to import image files of any size which will be converted by the A 6530 or A 6540 series PC software to a bitmap image.

Figure 18.1 illustrates an example on the use of splash screens. In this example a button is added and labelled "DEMO" and will be used to configure a Demo room. When the button is pressed a projector screen will drop from the wall, and the projector will start up. Because the projector takes a while to warm up, a splash screen will be displayed to notify the user that the demo has been activated and to please wait.

				I	The room is being configured. Please wait		t J	Splash Screen	
		Show Sub Page	8		ок	Each button can only have one splash image. Changing it will affect all uses of the splash image for this button			

Fig 18.5

The only option available for the Splash screen is the delay. This delay corresponds to the amount of time the Splash screen will be displayed after being initiated.

Note: Setting the delay to 0 ms will put the splash screen into "Auto mode", which means the splash screen will be displayed until all following commands for the button have been executed. Setting the delay to any other value will display the Splash Screen for that amount of time, and no other commands can be initiated until the time elapses.

In our example shown below in figure 18.6 the splash screen delay has been set to Oms, and it is the first command in the button actions. The next two commands turn the projector ON and put the projector screen down. The delay after putting the projector screen down has been deliberatly set at 10,000 ms (10 sec) so that the splash screen is displayed until the projector has time to turn ON.

If the delay for the splash screen had been set to 10 sec instead of putting the delay after the projector screen, then the splash screen would have been displayed for 10 seconds and then the projector would have been turned on. The message telling the user to wait would have disappeared and the user would still be waiting for the projector to turn ON.

19.0 WALLPLATE COLOURS, BACKLIGHT, DIMMING and SCREENSAVER OPTIONS

19.1 Wallplate LCD Background and Text Colours

The Redback® A 6530 or A 6540 series wallplate comes standard out of the box with white text on a black background. Both of these can be adjusted by navigating to the "Screen" tab and selecting Background or Text colour. To change the background colour, select the "Screen" tab and then select "Background Colour" as shown in figure 19.1.

19.2 Wallplate Dimming Time

The Redback® A 6530 or A 6540 series Wall plate has the option to dim the screen to a set backlight level, and also activate a static screensaver, after a user set amount of time with no screen contact. This time is set by navigating to the "Power Settings" tab and selecting the Dim Screen option as shown in figure 19.5. The time can be set anywhere between 0 and 180 minutes.

Note: If the Dim Screen time is set to 0 minutes the wallplate LCD will never dim and the screensaver will not activate.

Fig 19.5

19.3 Wallplate Backlight

The LCD backlight (or brightness) can be set from 0% which means the screen is not visible at all, up to 100% which is full brightness. This backlight setting is used in conjunction with the Dim Screen setting. An example of this is a follows - If the Dim Screen is set to 2 minutes and the Backlight is set to 30%, then after two minutes of no screen contact the screen backlight will drop to a brightness of 30% and stay that way until the screen is touched.

The Backlight percentage is set by navigating to the "Power Settings" tab and selecting the Backlight option as shown in figure 19.6. The percentage can be set anywhere between 0 and 100%.

Fig 19.6

19.4 Wallplate Screensaver

Like the backlight option in section 19.3, the Screensaver is used in conjunction with the Dim Screen time setting. If the screensaver option is used it will activate at a period of time twice the setting of the dim screen time. An example of this is as follows - The Dim Screen is set to 2 minutes and the Backlight is set to 30%. After two minutes of no screen contact the screen backlight will drop to a brightness of 30%, then after another two minutes the screensaver image will be displayed still at 30% brighness and stay that way until the screen is touched.

The Screensaver image is set by navigating to the "Power Settings" tab and selecting the Screen Saver option as shown in figure 19.7.

Note: If the Dim Screen time is set to 0 minutes the wallplate LCD will never dim and the screensaver will not activate.

20.0 PIR ACTIONS and TIMEOUT

The Redback® A 6530 or A 6540 series now has the option of a PIR (or closing conctact) trigger when combined with the A 6505A.

(Refer to the A 6530 or A 6540 series instruction manual for more details about the wiring connections). This useful trigger could be used to activate a series of commands, for instance when someone enters a room. The PIR action is set by navigating to the "PIR" tab and selecting the "Actions" option as shown in figure 20.1.
